This is the amino acid sequence of a recombinant protein comprising amino acids 1613-1705 of the Plasmodium falciparum merozoite surface protein 1 (MSP1) 19 kD C-terminal fragment (p19), linked to a glycosylphosphatidylinositol membrane anchoring sequence. p19 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high lavel of protective immunity since it includes epitopes not presented in the p42 fragment.

                                                                                                                                                                                                                                                                              8
```

The present invention relates to non-natural variants of a C-terminal fragment of a Plasmodium merozoite surface protein-1 (MSP-1). The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1\_4\_2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1\_4\_2. The non-natural variants of the present invention are useful for immunising a mammal against malaria, and can be used to treat malaria. The present sequence is MSP-119 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to non-natural variants of a C-terminal fragment of a Plasmodlum merozoite surface protein-1 (MSP-1). The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of Plasmodlum MSP-14-2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of Plasmodlum MSP-12-9. The present sequence is the wild-type MSP-1 protein. This sequence was used to generate the variants of the present invention. The non-natural variants of the present invention. The mon-natural variants of the present invention are useful for immunising a mammal against malaria, and can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        281 NISQHQCVKKQCPENSGCFRHLDEREECKCLLNYKQEGDKCEENPNPTCNENNGGCDADA 340

The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.

This is the amino acid sequence of a chimeric protein comprising amino acids 1-32 of the plasmodium vivax merozoite surface protein 1 (MSP1) linked to amino acids Asni613-Ser1705 which correspond to the 19 kD c-terminal fragment (pl9) of MSP-1 from Plasmodium falciparum. pl9 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the pl9 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ţ

                           This sequence represents a modified Plasmodium falciparum gp190/MSP-1 (merozolte surface) protein. The gene encoding this protein has been stabilised by reducing the AT content of the nucleotide sequence. Such a protein is useful in vaccines against malaria or for producing monoclonal antibodies (for passive immunisation). The complete gp190 protein can now the produced outside the parasite and has, at least over extended regions, the native pattern of folding. Larger amounts of the protein can be produced recombinantly than would be possible using the parasites as

The present sequence represents a 42 kDa C-terminal portion of malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an importent target for the development of a vaccine against importent target for the development of a vaccine against the plasmodium falciparum. The nucleic acid sequence encoding MSP-1-42 has been modified (see AAX56008) compared to the native sequence (see AAX56009) such that 306 nucleotide positions have been replaced to lower the AT content (from 76 to 49.7%) and to eliminate 10 mRNA instability motifs while maintaining the same protein amino acid sequence. These alterations allow MSP-1-42 to be expressed in mammalian cell culture and in transgenic mice. Native MSP-1-12 is known to be difficult to express in cell culture systems. Commamalian cell culture systems or in transgenic animals. The invention allows expression of MSP-1 protein in the milk of transgenic animals, and also provides a DNA vaccine comprising a vector containing the altered MSP-1-42 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ||| ||:|||| || sekyksdldsikkyi-------ndkqgenekylpflnnietlyktvn 166

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Important target for the development of a vaccine against
Important target for the development of a vaccine against
Inflation and falciparum. The nucleic acid sequence encoding MSP-1-42
Islamoduum falciparum. The nucleic acid sequence encoding MSP-1-42
Islamoduum falciparum. The nucleic acid sequence encoding MSP-1-42
Instability motifs while maintaining the same protein amino acid sequence. These alterations allow MSP-1-42 to be expressed in mammalian cell culture and in transgenic mice. The invention provides modified recombinant nucleic acid sequences and methods for increasing the mRNA levels and protein expression of proteins that are difficult to express in cell culture systems, mammalian cell culture systems or in transgenic animals. The preferred difficult corpusing such as parasites, bacteria and viruses that have DNA coding sequences of high AT content or which have mRNA instability motifs or rare codons relative to the recombinant expression system and machine and expression system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             126 LAKYKDDLESIKKVIKEEKEKFPSSPPTTPPSPAKTDEQKKESKFLPFLTNIETLYNNLV 185

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   to be used. The invention allows expression of MSP-1 protein in the milk of transgenic animals, and also provides a DNA vaccine comprising a vector containing the altered MSP-1-42 sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This present sequence comprises a 42 kDa C-terminal portion of malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against plasmodium falciparum. The C-terminal end of the sequence is modified to include a 6xHis tag. A nucleic acid (see AAX5608) encoding MSP-1-42 has been modified according to a method of the invention in order to improve expression in mammalian cells and in transgenic animals by reducing the AT content and removing mRNA instability motifs. The invention allows expression of MSP-1-42 in the milk of transgenic animals, and also provides a DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   vaccine comprising a vector containing the altered MSP-1-42 nucleic

The C-terminal end of the sequence is modified to include a 6xHis tag. Nucleic acids (see AAX25586 and AAX25593) encoding MSP-1-42 have been modified according to a method of the invention in order to improve expression in mammalian cells and in transgenic animals. The invention provides modified recombinant nucleic acid sequences and methods for increasing the mRNA levels and protein expression of proteins that are difficult to express in cell culture systems, especially mammalian cell

culture systems or in transgenic animals. The preferred difficult protein candidates for expression are those derived from lower organisms such as parasites, bacteria and viruses that have DNA coding sequences of high AT content or which have mRNA instability motifs or rare codons relative to the recombinant expression system to be used. The invention allows expression of MSP-1 in the milk of transgenic animals, and also provides a DNA vaccine comprising a vector containing the altered MSP-1-42 nucleic acid.

                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a 42 kDa C-terminal portion of malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against Plasmodium falciparum. The sequence has been modified to include an N-terminal beta-casein signal peptide and an N-terminal of SKH is and N2620 mutations have been introduced eliminate 2 N-01ycosylation sites. These modifications allow the MSP-1-42 protein to be expressed in the milk of transgenic mice.

The present sequence represents a 42 kDa C-terminal portion of malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against plasmodium falciparum. The sequence has been modified to include now terminal beta-casein signal peptide and an N-terminal 6xHis tag. In addition, N1810 and N2620 mutations have been introduced to eliminate 2 N-glycosylation sites. These modifications allow the MSP-1-42 protein to be expressed in the milk of transgenic mice. The invention generally relates to modified recombinant nucleic acid sequences and methods for increasing the mRNA levels and protein expression of proteins that are difficult to express in call culture systems. The preferred difficult protein candidates for transgenic animals. The preferred difficult protein candidates for bacteria and viruses that have DNA coding sequences of high AT content or which have mRNA instability motifs or rare codons relative to the recombinant expression system to be used.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ಧ

The present invention relates to non-natural variants of a C-terminal fragment of a Plasmodium merozoite surface protein-1 (MSP-1). The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of plasmodium MSP-1_4_2, and has the same affinity for at least MSP-1_4_2, compared to natural MSP-1_1_9. The non-natural variants of the present invention are useful for immunising a mammal against malaria, and can be used to treat malaria. The present sequence is MSP-133 protein.

This is the amino acid sequence of a recombinant protein comprising amino acids 1613-1705 of the Plasmodium falciparum merozoite surface protein 1 (MSP1) 19 KD C-terminal fragment (p19), linked to a glycosylphosphatidylinositol membrane anchoring sequence. p19 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high lavel of protective immunity since it includes epitopes not presented in the p42 fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       96..116

```

œ

```
The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.
                                                                                        p19 is the
This is the amino acid sequence of a recombinant protein comprising amino acids 1613-1705 of the Plasmodium falciparum merozoite surface protein 1 (MSP1) 19 kD C-terminal fragment (pll), inlked to a glycosylphosphatidylinositol membrane anchoring sequence. pl9 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species.

Novel variants of the C-terminal fragment of Plasmodium merozoite surface protein-1, useful as vaccines for treating or preventing malaria -

Example 5; Fig 15; 126pp; English.

fragment of a plasmodium merozoite surface protein-1 (MSP-1). The non-natural variants have reduced affinity for at.least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of plasmodium MSP-1\_4\_2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1\_4\_2, and proteolytic cleavage of Plasmodium MSP-1\_4\_2, more an unitarial variants of the present invention are useful for immunising a mammal against malaria, and can be used to treat malaria. The present sequence is MSP-119 protein. present invention relates to.non-natural variants of a C-terminal The

ô The present invention relates to non-natural variants of a C-terminal fragment of a Plasmodium merozoite surface protein-1 (MSP-1). The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of plasmodium MSP-14.2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of Plasmodium MSP-12.9. The present sequence is the wild-type MSP-1 protein. This sequence was used to generate the variants of the present invention. The non-natural variants of the present invention are useful for immunishing a mammal against malaria, and can be 281 NISQHQCVKKQCPENSGCFRHLDEREECKCLLNYKQEGDKCVENPNPTCNENNGGCDADA 340 Gaps 1. nisqhqcvkkqcpqnsgcfrhldereeckcllnykqegdkcvenpnptcnennggcdada . 0 Length 96; Indels Score 553; DB 22; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This is the amino acid sequence of a chimeric protein comprising amino acids 1-32 of the plasmodium vivax merozoite surface protein 1 (MSP1) linked to amino acids Asn1613-Ser1705 which correspond to the 19 kD c-terminal fragment (p19) of MSP-1 from Plasmodium falciparum. p19 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               33..34

acids 1-32 of the Plasmodium vivax merozoite surface protein 1 (MSP1) linked to amino acids Asn1613-Ser1705 which correspond to the 19 kD C-terminal fragment (p19) of MSP-1 from Plasmodium falciparum. p19 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ç
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This is the amino acid sequence of a chimeric protein comprising amino
